Return Stacked® ETFs

Quarterly Commentary

Q4 2025

Case #f75811e2-c755-4aa3-b48c-6962338e621f

Introduction

We introduced the Return Stacked® suite of ETFs in 2023 with a single goal in mind: to help investors better unlock the benefits of diversification with a series of capital efficient building blocks. We believe that the prudent application of leverage can allow investors to retain their core stock and bond exposures while introducing additional, diversifying return streams to stack on top of their core portfolio's return. As such, each ETF in the suite follows a similar design: providing $2 of exposure for every $1 invested.

In Q4 2025, the Return Stacked® ETF suite exceeded $1 billion in assets under management. We are grateful for the trust our allocators have placed in us and do not take the stewardship of these assets lightly. We believe this milestone reflects growing recognition of the potential role return stacking can play in portfolio construction, and we are encouraged by the continued development of the category.

The Return Stacked® Suite of ETFs

	Name	Ticker	Base	Stack	Launch Date	AUM (Millions)

CONCLUSION **31**

Return Stacked® Global Stocks & Bonds (RSSB)

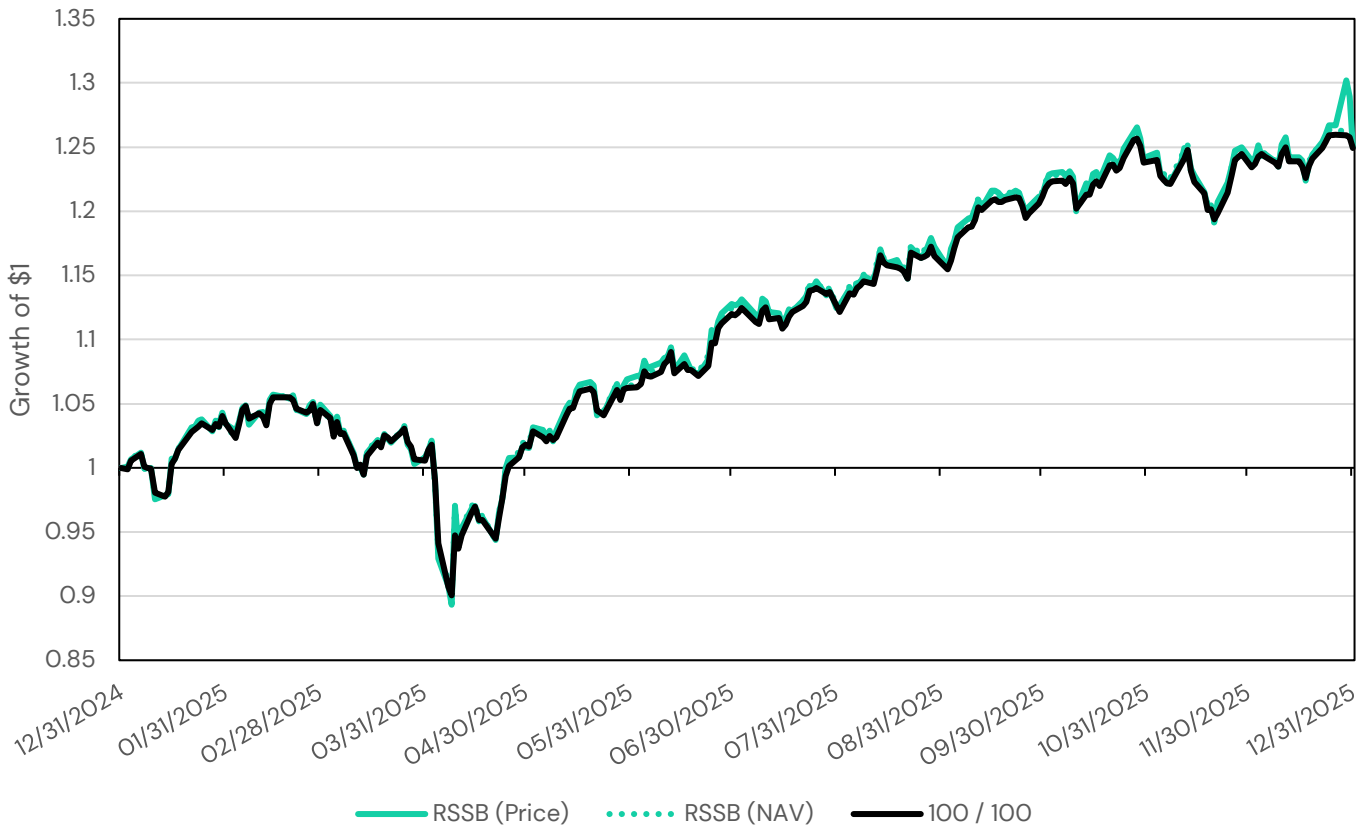
The aim of the Return Stacked® Global Stocks & Bonds ETF (RSSB) is to provide $1 of exposure to a global equity strategy and $1 of exposure to a U.S. Treasury strategy, for every $1 invested. The global equity strategy aspires to match market-capitalization weighted global equity markets, while the U.S. Treasury strategy is engineered as an equal-weight ladder of 2-, 5-, 10-year, and U.S. long bond Treasury futures.

The fund is designed to provide investors with *capital efficiency*. Capital efficiency refers to the ability for an investment to provide the same absolute exposure to a particular asset class or strategy while investing relatively fewer overall dollars. By using a capital efficient fund to implement strategic exposure, investors can free up capital in their portfolio. Investors can then "choose their own stack" by using this freed-up capital to invest in any diversifying asset class or strategy of their choice, effectively turning it into an "overlay" on their portfolio.

Performance

RSSB returned 2.92% (NAV) versus 3.14% for a 100% Global Equity + 100% U.S. Treasury ("100/100") portfolio in Q4. Figure 1 plots the returns of the ETF versus a 100/100 portfolio over the last 12 months.

Figure 1: RSSB's Prior 12-Month Performance



Source: Bloomberg. Global Stocks is the FTSE Global All Cap Index (GEISAC). U.S. Treasuries is the Bloomberg U.S. Treasury Total Return Unhedged Index (LUATTRUU). U.S. T-Bills is the Bloomberg Short Treasury Total Return Index Value Unhedged Index (LD12TRUU). 100/100 is 100% Global Stocks / 100% U.S. Treasuries / -100% U.S. T-Bills, rebalanced daily. Index returns are hypothetical. You cannot invest in an index. Returns assume the reinvestment of all distributions (net of foreign withholding taxes). Please see glossary at the end of this commentary for index definitions. Period is December 31, 2024 through December 31, 2025. The performance data quoted above represents past performance. Past performance does not guarantee future results. The investment return and principal value of an investment will fluctuate so that an investor's shares, when sold or redeemed, may be worth more or less than their original cost and current performance may be lower or higher than the performance quoted above.

RSSB Standardized Performance

(December 4, 2023, through December 31, 2025)

	3-Month	6-Month	1-Year	3-Year	5-Year	Inception
RSSB (Price)	3.12%	10.87%	25.04%	--	--	20.71%
RSSB (NAV)	2.92%	11.19%	25.05%	--	--	20.66%

U.S. Treasuries	0.90%	2.43%	6.32%	--	--	4.69%
U.S. T-Bills	1.01%	2.12%	4.29%	--	--	4.83%
100/100	3.14%	11.55%	24.93%	--	--	21.46%

Source: Bloomberg. Global Stocks is the FTSE Global All Cap Index (GEISAC). U.S. Treasuries is the Bloomberg U.S. Treasury Total Return Unhedged Index (LUATTRUU). U.S. T-Bills is the Bloomberg Short Treasury Total Return Index Value Unhedged Index (LD12TRUU). 100/100 is 100% Global Stocks / 100% U.S. Treasuries / -100% U.S. T-Bills, rebalanced daily. Index returns are hypothetical. You cannot invest in an index. Returns assume the reinvestment of all distributions. Past performance is not indicative of future returns. Since inception returns less than a year are not annualized; since inception returns greater than a year are annualized. The total annual fund operating expense is 0.55%. The total annual fund operating expense after fee waiver is 0.40%. The Adviser has contractually agreed to waive all or a portion of its management fee until at least May 30, 2026 from exceeding 0.35%.

The performance data quoted represents past performance. Past performance does not guarantee future results. The investment return and principal value of an investment will fluctuate so that an investor's shares, when sold or redeemed, may be worth more or less than their original cost and current performance may be lower or higher than the performance quoted. For the most recent month-end performance, please visit the Fund's website at https://www.returnstackedetfs.com/rssb-return-stacked-global-stocks-bonds/. The market price is the final price at which a security is traded on a given trading day. Net Asset Value (NAV) is value per share on a specific date or time. Returns less than one year are cumulative.

Return Stacked® Bonds & Managed Futures (RSBT) and Return Stacked® U.S. Stocks & Managed Futures (RSST)

The aim of the Return Stacked® Bonds & Managed Futures ETF (RSBT) is to provide $1 of exposure to a bond strategy and $1 of exposure to a managed futures strategy, for every $1 invested. The bond strategy aims to track the broad U.S. bond market, and the managed futures strategy is engineered to replicate the excess returns of the broad managed futures trend-following space.

Similarly, the aim of the Return Stacked® U.S. Stocks & Managed Futures ETF (RSST) is to provide $1 of exposure to a U.S. equity strategy and $1 of exposure to a managed futures strategy for every $1 invested. The U.S. equity strategy aims to track large-cap U.S. equities, while the managed futures strategy seeks to replicate the excess returns of the broad managed futures trend-following space.

Both funds are designed to allow investors and allocators to introduce managed futures into their portfolio without having to sacrifice core stock and bond exposure. By selling U.S. equity exposure and buying RSST, or selling fixed income and buying RSBT, an investor has the opportunity to retain similar long-term stock and bond returns while adding the potential diversification and return stream of managed futures. In effect, when used this way, the funds allow investors to "stack" managed futures on top of their existing portfolio.

Replication Performance

Given the significant degrees of freedom that govern the design of managed futures strategies, the category is notorious for performance dispersion among its managers. Our goal in implementing a replication-based approach is to try to provide "index-like" exposure to the category, reducing single-manager dispersion risk.

The question to ask is, "in practice, how well have the strategies tracked their targets?" Our expectation is that the managed futures strategy will be responsible for most of each fund's tracking error, so we will focus our analysis there.

The managed futures strategy trades 27 futures contracts (including equity, bond, currency, and commodity markets) and employs two different approaches in trying to replicate the managed futures trend-following category:

1. **Top Down:** A regression-based approach that seeks to identify the portfolio of futures contracts that would have replicated the recent returns of the managed futures trend-following category. The top-down approach is implemented two ways: with a constrained 9-contract universe ("Top Down #1") as well as the full 27-contract universe ("Top Down #2").

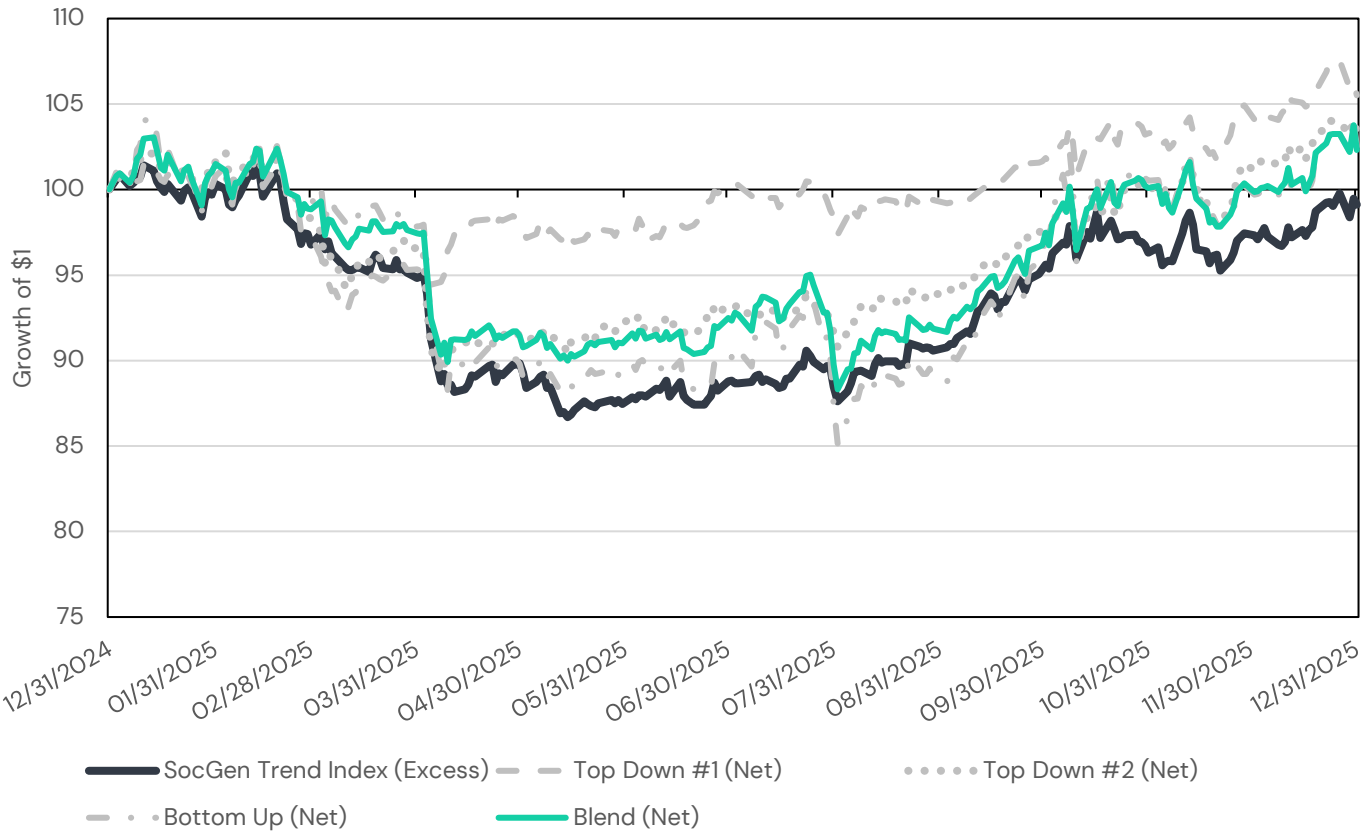
2. **Bottom Up:** A composite trend-following model parameterized such that it has historically provided a high degree of fit to the broad managed futures trend-following category.

The top-down approach tries to replicate returns while the bottom-up approach tries to replicate process. We blend these two approaches (30% Top Down and 70% Bottom Up) to arrive at our target weights.

The trend replication model returned 5.8% (excess and net of estimated transaction costs and fees) in Q4 versus 4.0% (excess) for the Société Générale Trend Index (NEIXCTAT). For the full year, the replication model returned 2.3% (excess and net of estimated transaction costs and fees) versus -0.9% (excess) for the NEIXCTAT.

In Figure 2, we plot the prior 12-months' performance of each approach.

Figure 2: Managed Futures Program Model Returns (Prior 12 Months)

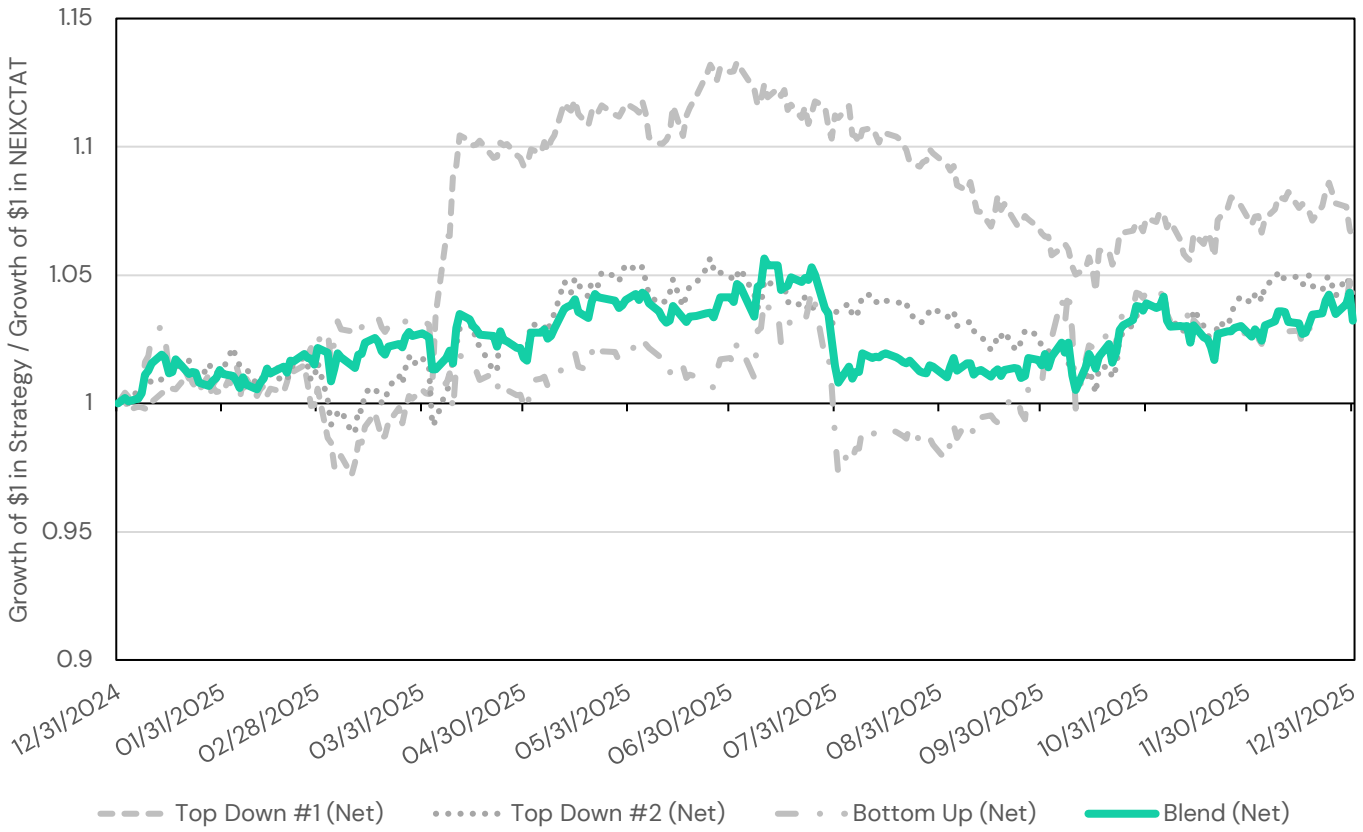


Source: Bloomberg; ReSolve Asset Management SEZC (Cayman). Calculations by Newfound Research. Top Down #1 (Net), Top Down #2 (Net), Bottom Up (Net), and Blend (Net) are the hypothetical model returns of replication strategies implemented in RSBT and RSST. Top Down #1 (Net), Top Down #2 (Net), and Bottom Up (Net) are net of estimated trading costs and a 0.95% annual expense ratio. Blend (Net) is a 15% Top Down #1 (Gross) / 15% Top Down #2 (Gross) / 70% Bottom Up (Gross) portfolio rebalanced daily, net of estimated trading costs and a 0.95% annual expense ratio. SocGen Trend Index (Excess) is the Société Générale Trend Index (NEIXCTAT) minus the Bloomberg Short Treasury Total Return Index Value Unhedged Index (LD12TRUU). Returns assume the reinvestment of all distributions. Returns of NEIXCTAT are net of underlying fees. Index returns are hypothetical. You cannot invest in an index. Past performance is not indicative of future returns. Please see glossary at the end of this commentary for index definitions. Period is December 31, 2024 through December 31, 2025. This material is for illustrative purposes only and is not meant to reflect the actual investment in the RSBT or RSST ETFs.

In Figure 3, we plot the relative performance of each approach versus NEIXCTAT.

For clarity, note that Figure 3 should be interpreted as: *when the line is going up, the model is outperforming NEIXCTAT; when the line is going down, the model is underperforming NEIXCTAT; perfect replication would be a flat, horizontal line.*

Figure 3: Relative Returns of Managed Futures Models vs the NEIXCTAT (Prior 12-Month)



Source: Bloomberg; ReSolve Asset Management SEZC (Cayman). Calculations by Newfound Research. The plot shows the ratio of the model equity curves in Figure 2 versus the equity curve of NEIXCTAT in Figure 2. Please see important disclosures and definitions under Figure 2. Period is December 31, 2024 through December 31, 2025.

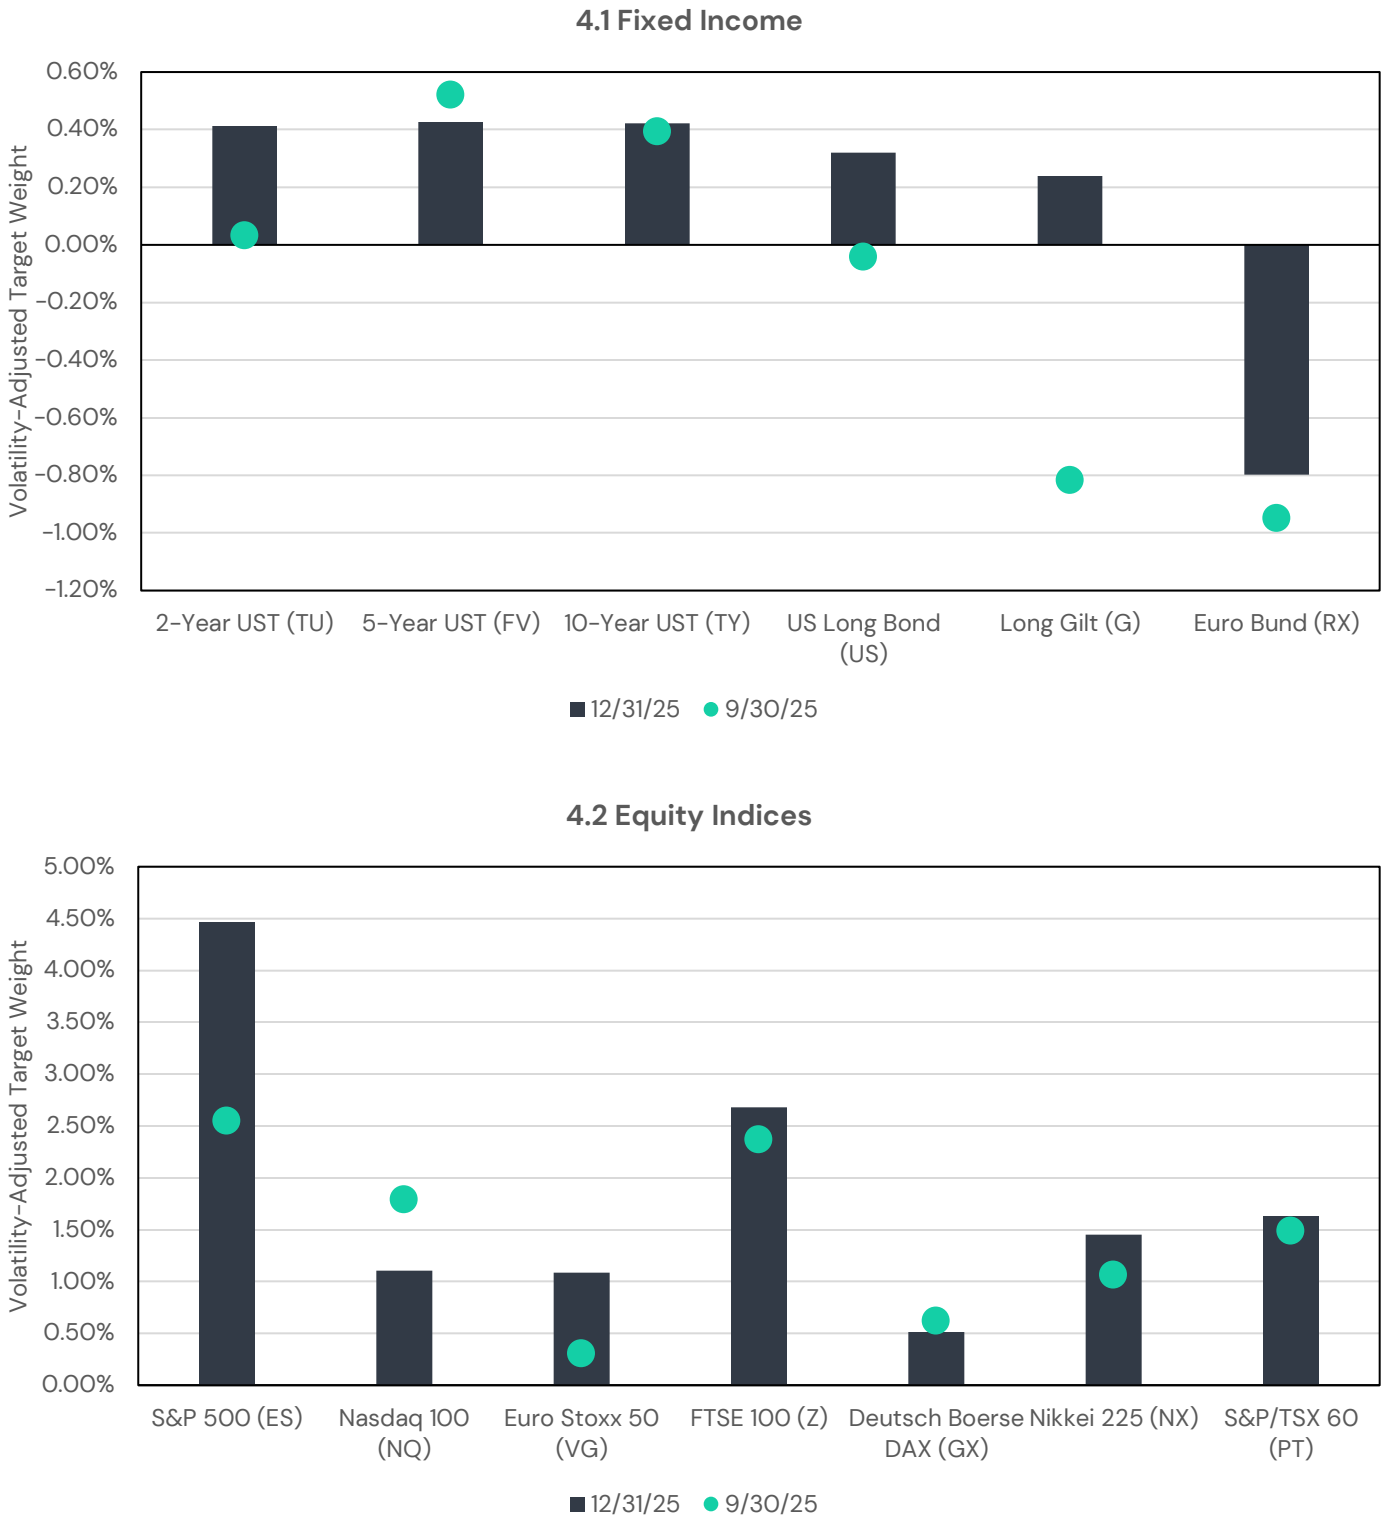
We're encouraged to see that our ensemble replication process continues to track the broad managed futures space closely.

Positioning & Return Contribution

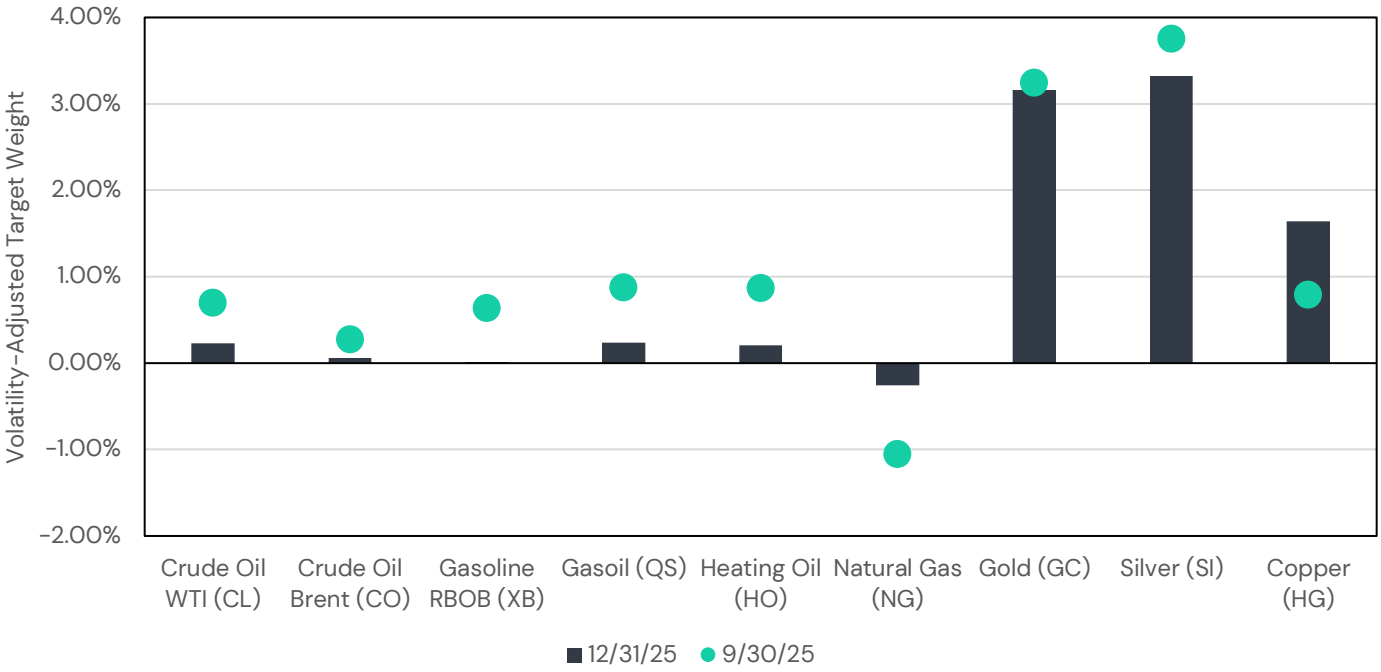
Finally, we want to address how the managed futures program reacted in Q4 2025, and then how it is positioned entering Q1 2026.

Figure 4 lays out the model's volatility-adjusted target weights for the managed futures program broken into bond, equity, commodity, and currency futures. Figure 5 provides estimated Q4 '25 and prior 12-month contribution at a position level.

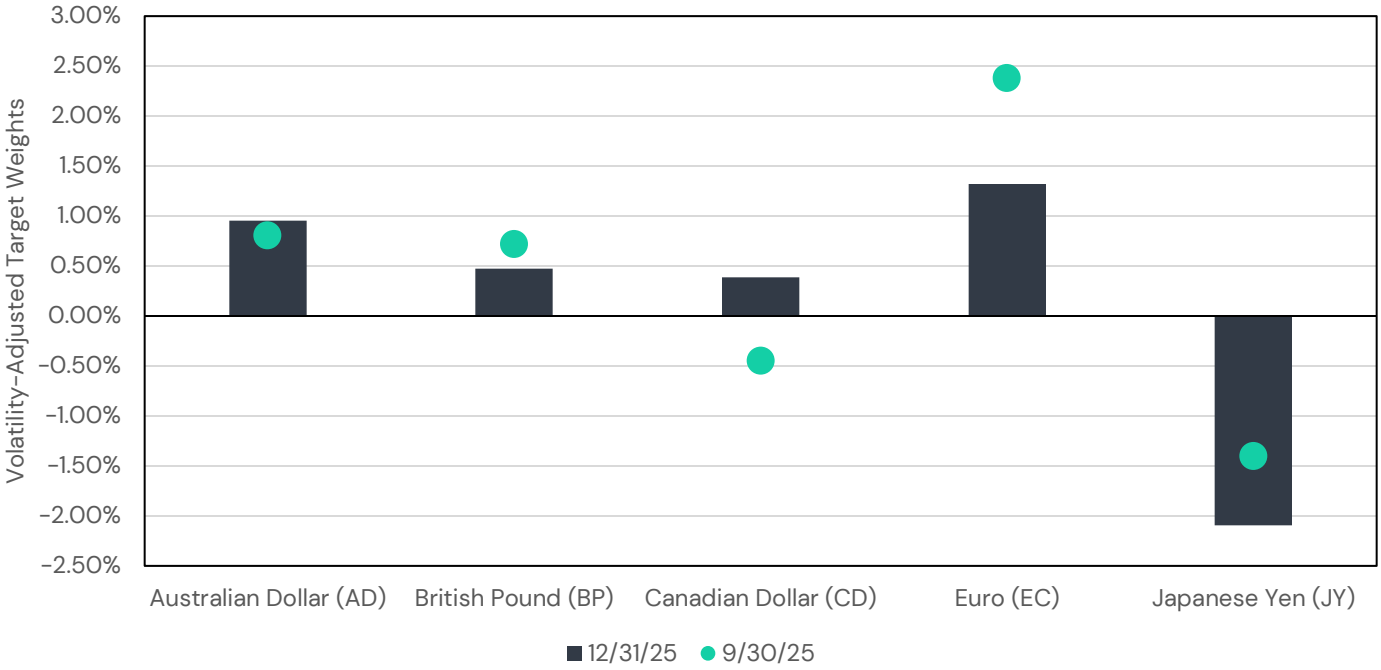
Figure 4: Managed Futures Volatility-Adjusted Model Weight Changes in Q4 2025



4.3 Commodities



4.4 Currencies



Source: ReSolve Asset Management SEZC (Cayman). For illustrative purposes only. Target Weights reflect target allocations and may not reflect the actual weights held within RSBT or RSST. Volatility-Adjusted Target Weights multiply Target Weights by a 63-day exponentially-weighted volatility measure. Holdings are subject to change.

A few important points to make before analyzing these graphs. First, the weights are volatility adjusted; they do not reflect the actual weights targeted by the managed futures program. By volatility-adjusting the weights, positions in contracts with drastically different intrinsic volatilities can be more easily compared (e.g. 2-year U.S. Treasuries versus the S&P 500). Second, these are a point-in-time snapshot of target weights. Managed futures is a dynamic strategy, and these weights can shift meaningfully, in short order.

There were a few key trends that occurred from a positioning perspective over the quarter:

- The program generally increased exposure to equities, with the exception of the Nasdaq 100 exposure, which was trimmed.

- Despite significant Q4 rallies in gold and silver, the program actually cut exposure, reflecting the significant increase in each market's volatility. Gold's annualized volatility[1] climbed from 14.1% at the beginning of the quarter to 22.2% to end it; Silver's climbed from 22.9% to 64.1%.

- The program increased net exposure to global fixed income.

Return Stacked® Bonds & Futures Yield (RSBY) and Return Stacked® U.S. Stocks & Futures Yield (RSSY)

The aim of the Return Stacked® Bonds & Futures Yield ETF (RSBY) is to provide $1 of exposure to a bond strategy and $1 of exposure to a futures yield (carry) strategy for every $1 invested. The bond strategy attempts to track the broad U.S. bond market, while the futures yield strategy invests long and short across commodities, currencies, bonds, and equities via futures contracts using a systematic, quantitative process that seeks to harvest roll yield (carry) in futures contracts.

Similarly, the aim of the Return Stacked® U.S. Stocks & Futures Yield ETF (RSSY) is to provide $1 of exposure to a U.S. equity strategy and $1 of exposure to a futures yield (carry) strategy for every $1 invested. The U.S. equity strategy attempts to track large-cap U.S. equities, while the futures yield strategy invests long and short across commodities, currencies, bonds, and equities via futures contracts using a systematic, quantitative process that seeks to harvest roll yield (carry) in futures contracts.

The funds are designed to allow investors and allocators to introduce a multi-asset carry strategy into their portfolio without having to sacrifice core stock and bond exposure. By selling U.S. equity exposure and buying RSSY, or selling fixed income exposure and buying RSBY, an investor has the opportunity to retain similar long-term stock and bond returns while adding the potential diversification and return stream of a multi-asset carry strategy. In effect, when used this way, the funds allow investors to “stack” a multi-asset carry strategy on top of their existing portfolio.

Performance

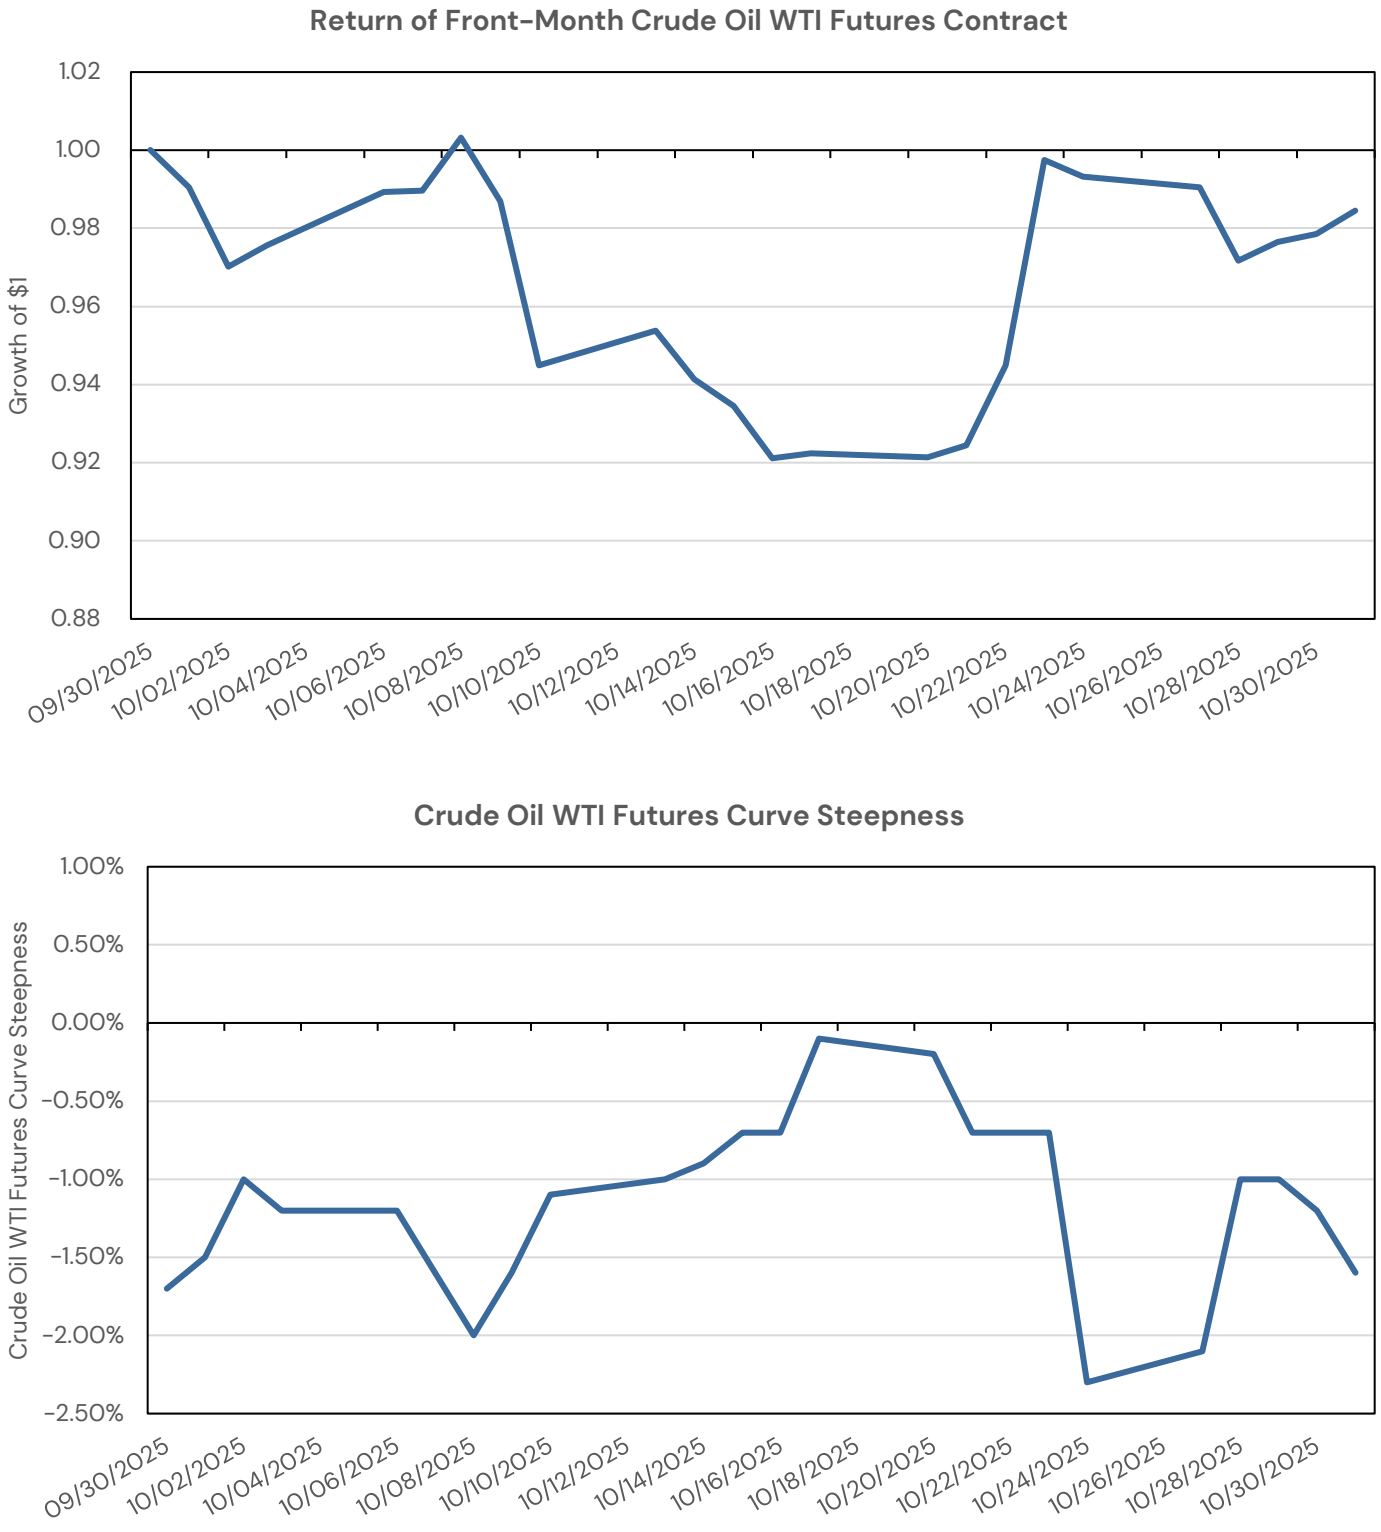
The Multi-Asset Carry program – net of estimated transaction costs and fees – returned approximately -4.5% in Q4. Losses were primarily driven by long positions in Crude Oil WTI, Crude Oil Brent, and Natural Gas, as well as short positions in Gold and Copper.

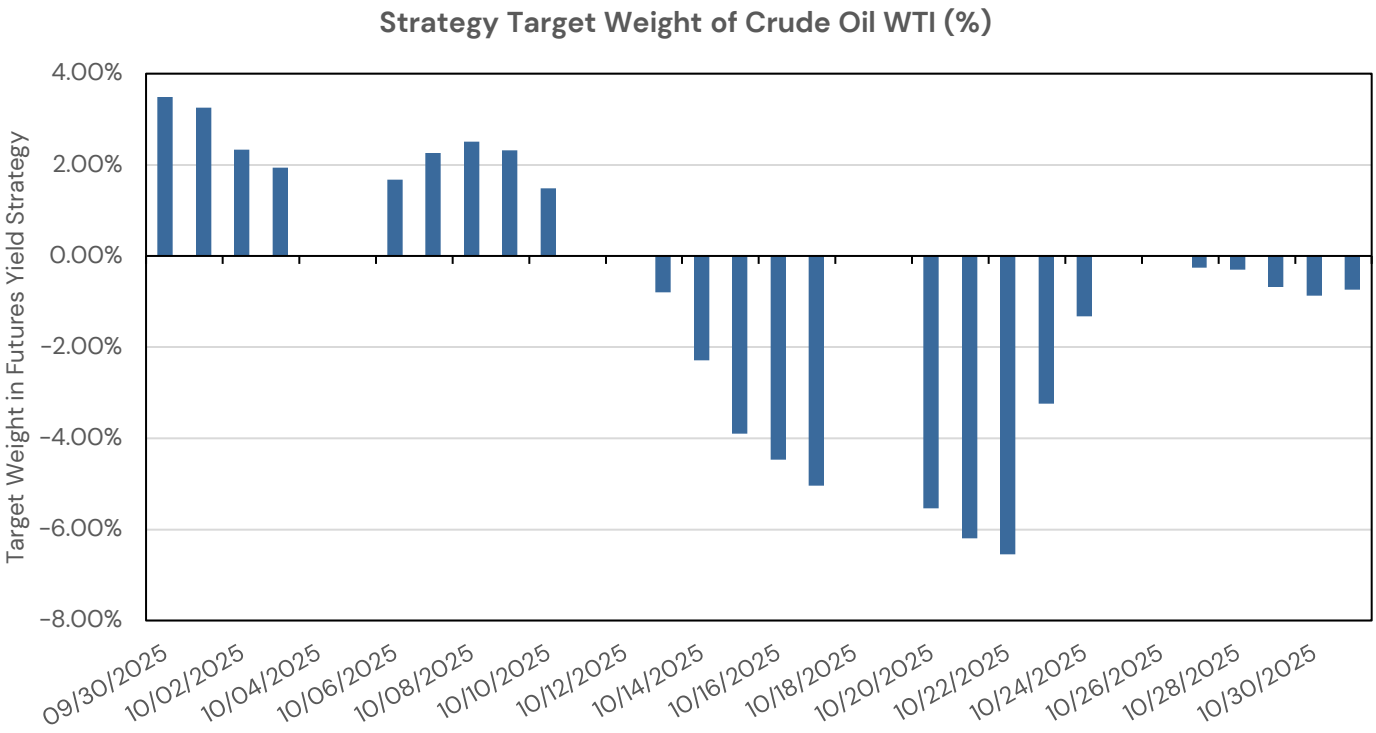
We recognize that carry performance since inception has been frustrating. In several recent environments, results have not lined up with investors’ expectations, which naturally raises questions about what has been driving returns.

To provide context for recent performance, we want to share a recent case study based on the return and positioning of Crude Oil WTI in the strategy.

The example that follows was selected to build intuition around the forces that shape carry performance and why periods of disappointment can occur even when the long-term rationale remains intact.

Figure 6: Crude Oil WTI, Futures Curve Steepness, and Target Strategy Weights in October 2025





Source: Bloomberg; ReSolve Asset Management SEZC (Cayman). Calculations by Newfound Research. Crude Oil WTI Futures Curve Steepness is the relative price of the 6th month contract ("CL6 Comdty") versus the 1st month contract ("CL1 Comdty"). Please see glossary at the end of this commentary for index definitions. Period is September 30, 2025 to October 31, 2025. This material is for illustrative purposes only.

Entering October, the crude oil WTI futures curve was meaningfully backwardated. Near-dated contracts traded at a premium to deferred contracts, reflecting perceived tightness in prompt supply and offering positive carry to long positions. In general, backwardation signals scarcity and encourages inventory drawdowns, while contango reflects surplus conditions and incentivizes storage.

Consistent with this backdrop, the strategy held a modest long exposure to crude oil at the start of the month. Importantly, a carry trader long the front month in a backwardated market is not being paid to store oil. Instead, they are being compensated for remaining exposed to the risk that near-term expectations can reverse abruptly, a risk other market participants are often seeking to avoid.

That environment shifted quickly in the first half of October. While geopolitical tensions remained present, market focus turned toward weakening demand expectations rather than any immediate loss of physical supply. Attention centered on ample global inventories, strong non-OPEC supply growth, and signs of softening demand tied to broader macroeconomic uncertainty. Despite ongoing headlines, there was no clear threat to near-term barrels.

As expectations adjusted, front-month crude prices declined by roughly 8 percent over a little more than a week and the futures curve flattened. The market began to discount the persistence of prompt tightness, eroding the carry that had initially supported the position. As the economics deteriorated, the strategy systematically reduced exposure. Losses from the early-month sell-off were realized at the same time that carry, which often helps cushion volatility, was fading.

In the second half of the month, the narrative shifted again. In late October, President Trump announced expanded sanctions targeting Russian oil exports, materially changing how markets assessed supply risk. Unlike earlier geopolitical developments, these measures directly targeted export flows and were viewed as more credible and enforceable. Markets responded by pricing a higher probability of near-term supply disruption.

This time, the futures curve reacted. Front-month prices rebounded more than 8 percent in a matter of days, deferred contracts lagged, and backwardation re-steepened as concerns about prompt scarcity re-emerged. In isolation, this is typically a favorable environment for carry strategies.

The challenge, however, was one of sequence and speed. By the time sanctions were announced, the strategy had moved significantly short in response to the earlier flattening of the curve. The re-steepening occurred rapidly and was driven by headline risk (a gap move) rather than a gradual tightening of inventories (gradual price change).

The result was a classic whipsaw. Losses were incurred during the early-month decline while long exposure was still in place. As carry deteriorated, exposure was reduced and a short position established. Shortly thereafter, renewed scarcity concerns triggered a sharp rally, leaving the strategy positioned on the wrong side of the move once again.

The broader lesson is that carry strategies tend to perform best when scarcity is persistent and expressed gradually through the curve. They struggle when markets oscillate between surplus and shortage narratives, forcing rapid shifts in positioning. October 2025 was challenging not because oil was unusually volatile, but because market expectations reversed faster than carry could be harvested.

Without placing too much emphasis on narrative over data, the post-June 2022 environment has been particularly hostile to front-month carry in oil. This period has featured a macro regime shift marked by higher inflation and interest rates, direct government intervention in prompt balances via the U.S. Strategic Petroleum Reserve, structural geopolitical disruptions from sanctions and price caps, and more frequent policy-driven supply signaling from OPEC.

Together, these forces have shortened the time frame over which expectations adjust. Front-month prices and curve shapes have repriced quickly, increasing the likelihood that price and curve movements overwhelm the incremental benefits of carry before they have time to accrue. In this environment, short-horizon outcomes depend less on the level of carry and more on the speed of expectation shifts.

In our view, carry has not stopped earning a premium. Rather, the risk it is designed to bear, namely rapid and abrupt repricing, has simply been realized more often.

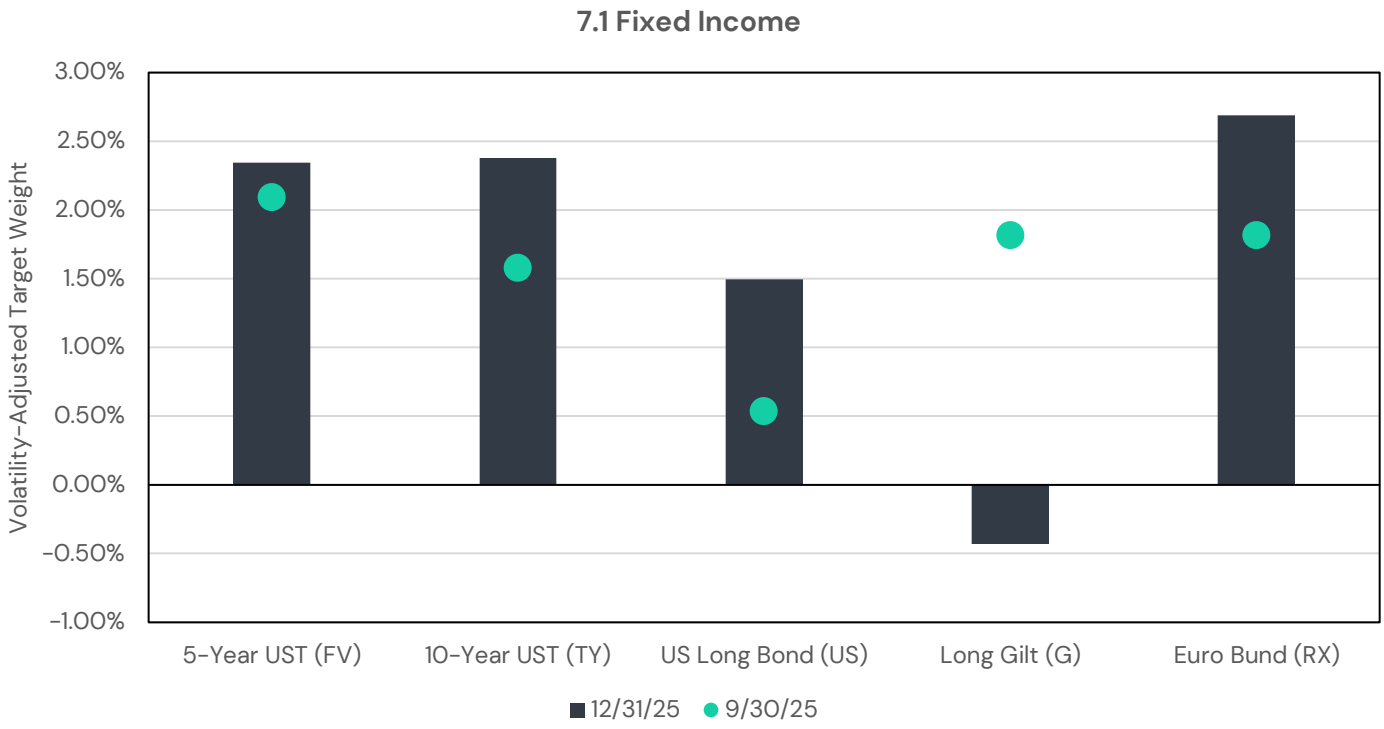
This dynamic helps explain why carry-oriented strategies such as RSSY and RSBY can struggle during periods defined by frequent expectation resets rather than stable supply-demand imbalances. Since inception, carry underperformance has been concentrated in markets most exposed to rapid macroeconomic repricing, including oil, gold, and copper, where policy, trade, and growth expectations has shifted quickly enough to outpace the accrual and tailwinds of carry.

This underscores an essential feature of carry investing. Carry is a risk premium, not a free return. Investors are compensated over time for bearing the risk that prices and curves can reprice sharply against prevailing expectations. These periods are uncomfortable, but they reflect the very risks that make carry difficult to hold and, ultimately, why we believe the strategy has historically rewarded patient investors.

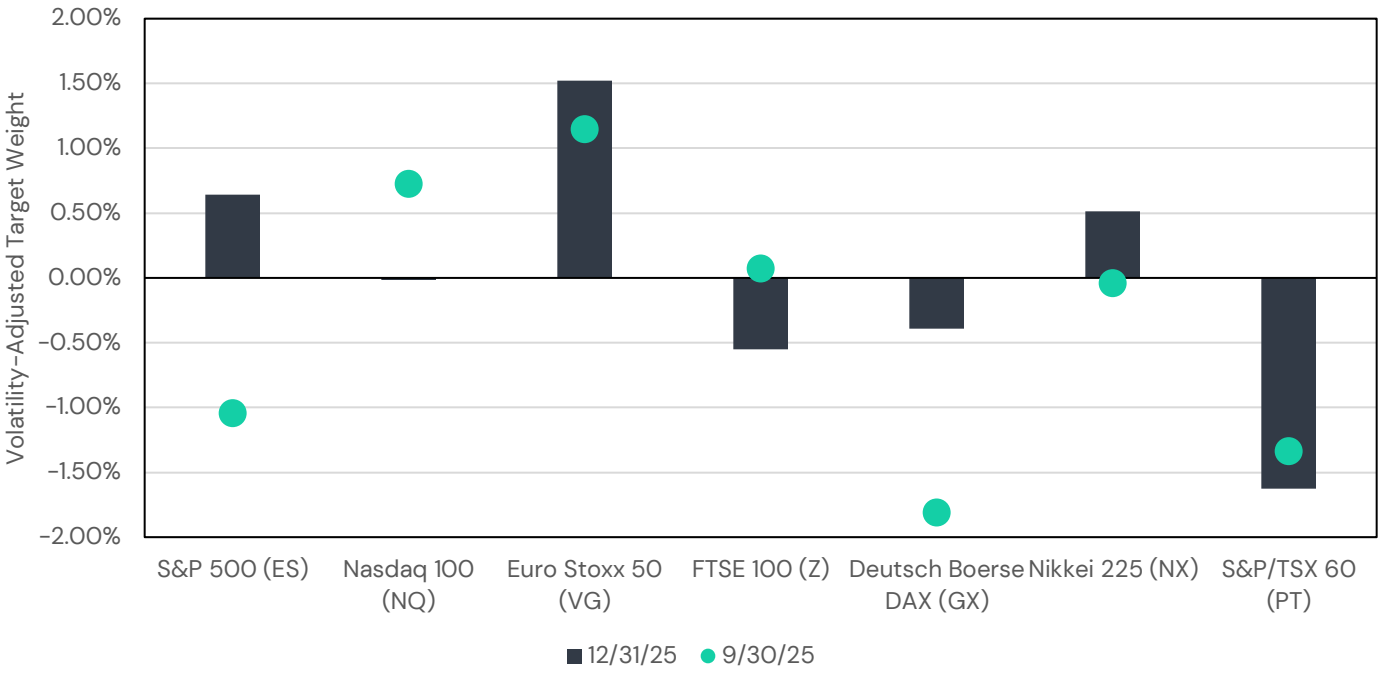
Positioning & Return Contribution

Figure 7 lays out the model's target weights for the multi-asset carry program broken out into bond, equity, commodity, and currency futures. Figure 8 provides estimated Q4 '25 and prior 12-month contribution at a position level.

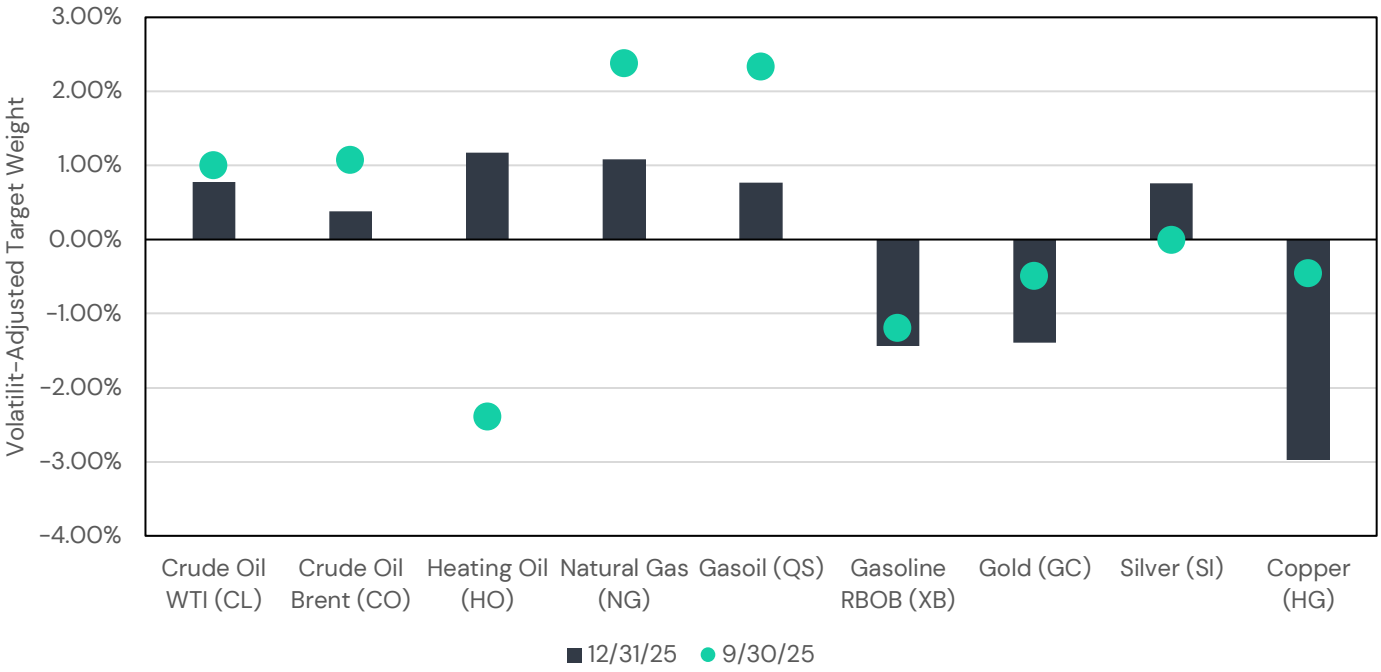
Figure 7: Multi-Asset Carry Model Weight Targets at End of Q4

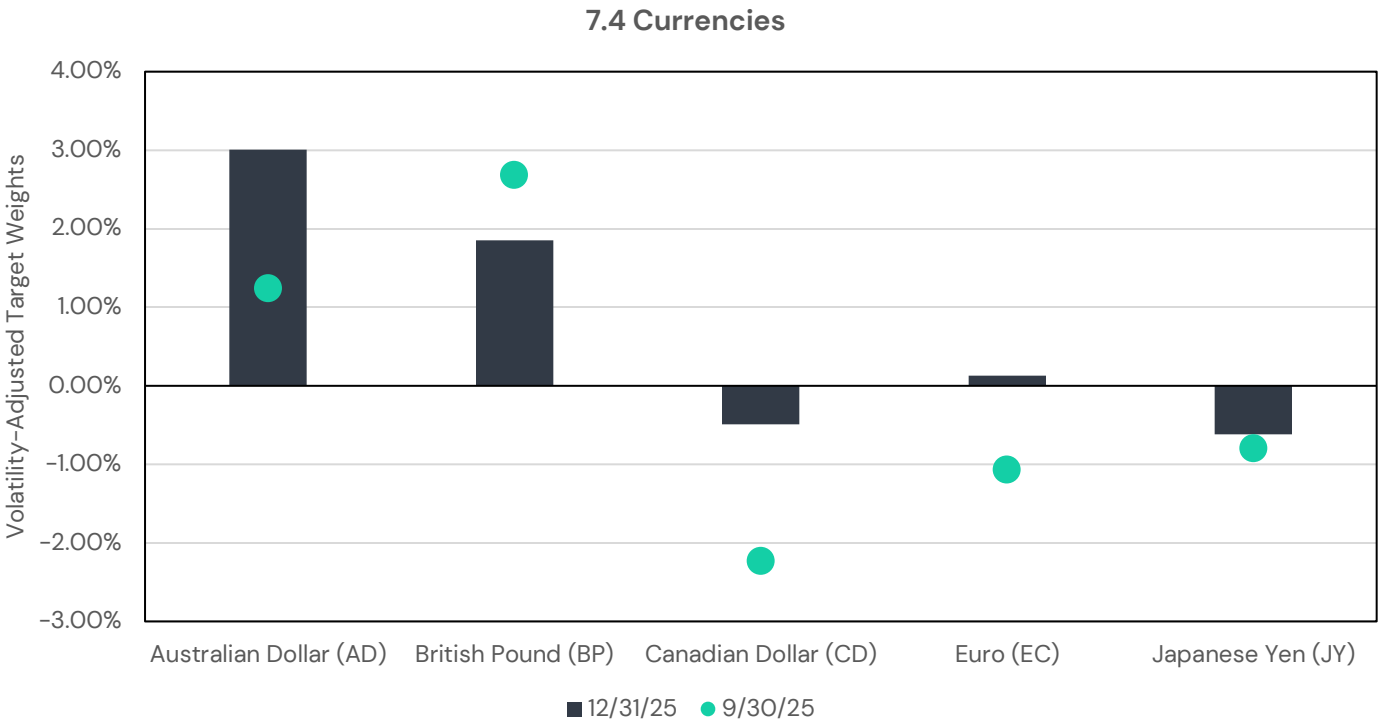


7.2 Equity Indices



7.3 Commodities





Source: ReSolve Asset Management SEZC (Cayman). For illustrative purposes only. Target Weights reflect target allocations and may not reflect the actual weights held within RSSY or RSBY. Holdings are subject to change. Volatility-Adjusted Target Weights multiply Target Weights by a 63-day exponentially-weighted volatility measure.

A few important points to make before analyzing these graphs. Again, the weights are volatility adjusted. As mentioned in the trend section above, this is done to acknowledge that a position with lower volatility and substantially greater weight may contribute an equal amount of risk as a position with higher volatility and lower weight. Second, these are again point-in-time snapshots of target weights. Futures yield is a dynamic strategy, and these weights can shift dramatically in short order.

- The program generally remains long on fixed income. In Q4, the program increased its exposure to U.S. Treasuries and the Euro Bund, though has trimmed its exposure to the Long Gilt.

- Equity exposure remains mixed. Exposure to the S&P 500 has shifted from negative to positive and a short in the Deutsch Boerse DAX has been significantly reduced. A meaningful short exposure to S&P/TSX 60 remains.

- Long positions in the energy complex were trimmed. Heating Oil shifted from short to long.

- Shorts in Gold and Copper were increased, while the program increased long exposure to Silver.

- Shorts in the Canadian Dollar, the Euro, and the Japanese Yen were all trimmed; a long in the Australian Dollar was increased. The net impact is reduced exposure to the U.S. Dollar.

Return Stacked® Bonds & Merger Arbitrage ETF (RSBA)

The aim of the Return Stacked® Bonds & Merger Arbitrage ETF (RSBA) is to provide $1 of exposure to core U.S. Treasuries and $1 of exposure to a merger arbitrage strategy, for every $1 invested.

Merger arbitrage is a strategy that invests in companies involved in publicly announced merger and acquisition deals. The strategy seeks to capture the spread between the current trading price and the expected deal price by taking two actions: (1) purchasing the stock of the acquisition target at a discount; and (2) shorting the acquirer (unless it is an all-cash deal).

The spread between the current trading price of the acquisition target and the deal price is usually a function of interest rates, the estimated time it will take for the deal to close (involving deal complexity and regulatory approvals), and risks to the deal falling apart (e.g. valuation, financing, shareholder composition, and regulatory approval). The greater the uncertainty in the deal, the greater the spread.

Merger arbitrage, therefore, is typically thought of as capturing a risk premium: investors are being paid to warehouse the risk that a deal falls through or takes longer to complete than originally expected.

The merger arbitrage strategy component of RSBA seeks to track the AlphaBeta Merger Arbitrage Index. The Index applies a machine learning model to proactively screen deals based upon their expected return.

The fund is designed to allow investors and allocators to introduce a merger arbitrage strategy into their portfolio without having to sacrifice core bond exposure. By selling U.S. Treasury exposure and buying RSBA, an investor has the opportunity to retain similar long-term bond returns while adding the potential diversification and return stream of a merger arbitrage strategy. In effect, when used this way, the fund allows investors to "stack" a merger arbitrage on top of their existing portfolio.

Positioning & Performance

The merger arbitrage strategy introduced five new positions throughout the quarter:

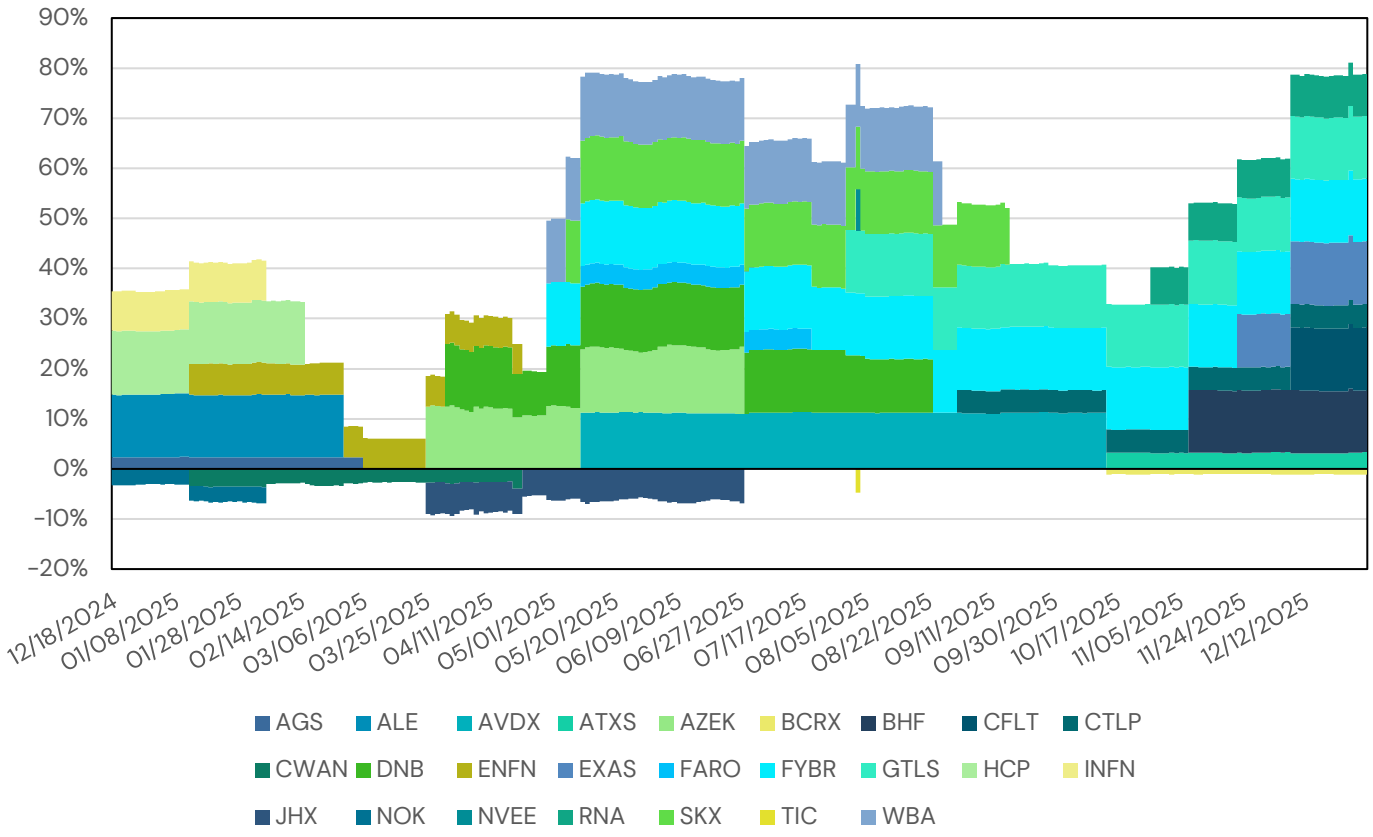
- 10/11/2025: Astria Therapeutics (ATXS) to be acquired by BioCryst Pharmaceuticals (BCRX)
- 10/20/2025: Avidity Biosciences (RNA) to be acquired by Novartis (NVS)
- 10/28/2025: Brighthouse Financial (BHF) to be acquired by Aquarian Capital
- 11/7/2025: Exact Sciences (EXAS) to be acquired by Abbott Laboratories
- 11/18/2025: Confluent (CFLT) to be acquired by IBM (IBM)

The strategy closed out one deal:

- 10/10/2025: AvidXchange (AVDX) was acquired by TPG

At the end of Q4, net exposure in the merger arbitrage strategy was approximately 77%, up from approximately 41% at the end of Q3.

Figure 9: Position-Level Exposure in RSBA over Time



Source: Internal calculations based upon end-of-day holdings in RSBA. For illustrative purposes only. An updated list of current holdings – including a table of the top 10 holdings – can be found at https://www.returnstackedetfs.com/rsba-return-stacked-bonds-merger-arbitrage/. Data provided for the period 12/18/24 through 12/31/2025.

December 17th marked the 1-year anniversary of RSBA. Since inception the AlphaBeta Merger Arbitrage Index – the merger arbitrage strategy we seek to track in this ETF – generated an annualized excess return of 2.45%[2] (annualized total return of 6.86%) with an annualized volatility of just 1.64%.

While the full-period return was less than the index's target (400 basis points above the risk-free rate), the net exposure over the period averaged just under 47% and ranged between 3% and 80%.

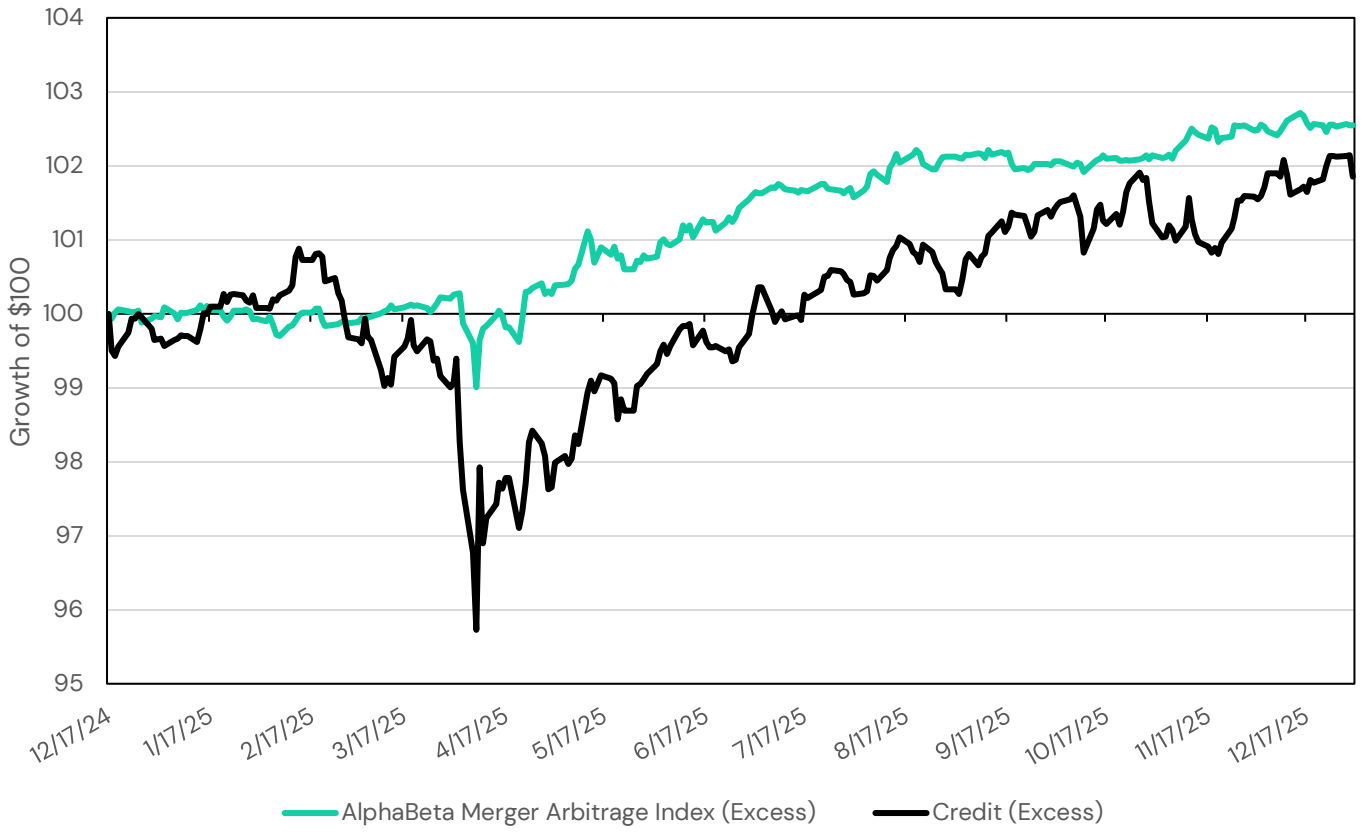
[2] Excess returns are measured net the Bloomberg Short Treasury Total Return Index Value Unhedged Index (LD12TRUU).

We consider the ebb and flow of deal exposure to be a key feature of the portfolio: rather than staying invested just for the sake of it, the strategy seeks to only deploy capital where the expected return for underwriting deal risk is sufficiently high.

In Figure 10, we plot the excess returns of the AlphaBeta Merger Arbitrage Index. As we believe RSBA can serve as both a replacement and diversifier to traditional corporate bond risk, we also plot the excess return of an interest-rate hedged U.S. corporate bond index, isolating the impact of credit risk on corporate bond returns. We can see over the period that not only did the AlphaBeta Merger Arbitrage index generate higher returns, but it also realized lower volatility and a lower maximum drawdown.

For investors who are currently allocated to U.S. corporate bonds – which can be effectively modeled as U.S. Treasury exposure plus a credit risk stack – we believe that U.S. Treasury exposure with a merger arbitrage stack is an attractive alternative.

Figure 10: Excess Returns of the AlphaBeta Merger Arbitrage Index since RSBA's Inception



Source: Bloomberg; AlphaBeta. AlphaBeta Merger Arbitrage Index (Excess) is the AlphaBeta Merger Arbitrage Index minus U.S. T-Bills. Credit (Excess) is BlackRock Interest Rate Hedged Corporate Bond Index (USIRHCRP) minus U.S. T-Bills. U.S. T-Bills is the Bloomberg Short Treasury Total Return Index Value Unhedged Index (LD12TRUU). Index returns are hypothetical. You cannot invest in an index. Returns assume the reinvestment of all distributions. Past performance is not indicative of future returns. These returns do not reflect the actual returns an investor achieved investing in RSBA. Data provided for the period 12/17/24 through 12/31/2025.

Return Stacked® U.S. Stocks & Gold/Bitcoin ETF (RSSX)

The aim of the Return Stacked® U.S. Stocks & Gold/Bitcoin ETF (RSSX) is to provide $1 of exposure to core U.S. Equities and $1 of exposure to Gold/Bitcoin strategy, for every $1 invested.

The Gold/Bitcoin strategy seeks to provide strategic exposure to both gold and bitcoin where each asset contributes an equal amount of risk to the portfolio. For example, if the estimated volatility of gold is 20% and the estimated volatility of bitcoin is 80%, the strategy would allocate 80% of the portfolio weight to gold and 20% to bitcoin. The weights are dynamic over time and rebalanced daily, allowing the strategy to acknowledge that gold and bitcoin currently exist at very different points in their global adoption cycles.

Exposure to gold and Bitcoin will be achieved via exchange traded funds and futures contracts; hence the fund does not invest directly in Bitcoin or any other digital assets, nor does it invest directly in gold or gold bullion.

The fund is designed to allow investors and allocators to introduce both gold and bitcoin into their portfolio without having to sacrifice core U.S. equity exposure. By selling U.S. equities exposure and buying RSSX, an investor has the opportunity to retain similar long-term equity returns while adding the potential diversification and return stream of gold and bitcoin. In effect, when used this way, the fund allows investors to "stack" a gold/bitcoin allocation on top of their existing portfolio.

For investors concerned about rising U.S. debt levels the risk of persistent inflation and global reserve diversification away from dollar assets, we believe that exposure to gold and bitcoin represent compelling propositions. By overlaying U.S. equity exposure with a risk-balanced Gold/Bitcoin strategy, an investor can maintain their underlying growth engine (equities) while introducing a potential hedge against U.S. dollar debasement.

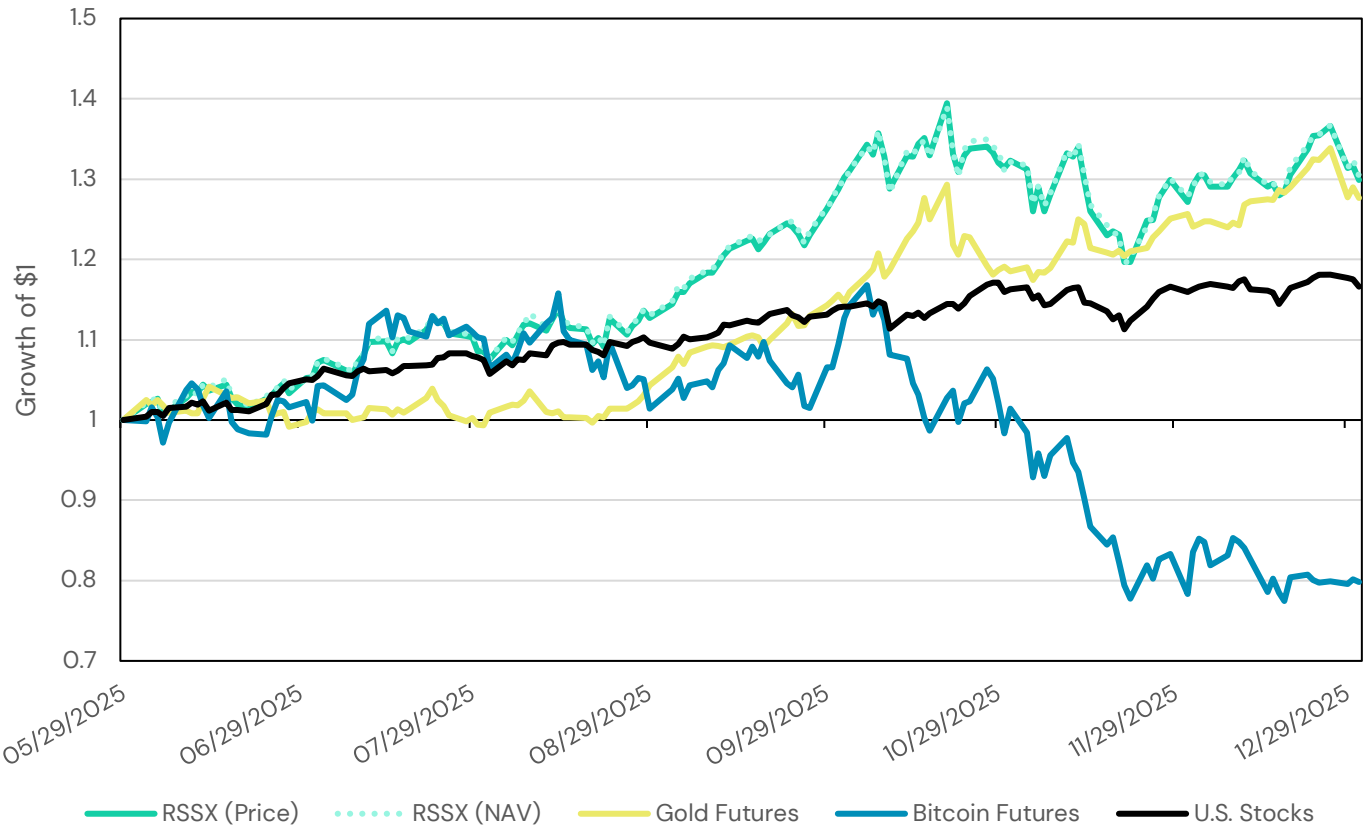
Positioning & Performance

In Q4 '25, RSSX returned 2.4% (NAV) while U.S. Stocks returned 2.7%, Gold futures returned 11.1%, and Bitcoin futures returned -25.0%.

The proportion of Gold to Bitcoin targeted in the fund is based upon their relative long-term volatility profiles. At the beginning of Q4 '25, the strategy targeted 74.6% exposure in Gold and 25.4% in Bitcoin. At the end of the quarter, the targets were 72.2% and 27.8% respectively.

The increase in Bitcoin exposure relative to Gold may come as a surprise given Bitcoin's drawdown in Q4. Interestingly, Bitcoin's long-term volatility declined over the quarter and it was Gold whose long-term volatility rose (from 16.8% to 18.7%).

Figure 11: RSSX's Performance Since Inception



Source: Bloomberg. Gold Futures is Generic 1st 'GC' Futures ("GC1 Comdty"). Bitcoin Futures is Generic 1st 'BTC' Futures ("BTC1 Comdty"). U.S. Stocks is the S&P 500 Total Return Index (SPXT). Index returns are hypothetical. You cannot invest in an index. Returns assume the reinvestment of all distributions. Period is May 28, 2025 through December 31, 2025. The performance data quoted above represents past performance. Past performance does not guarantee future results. The investment return and principal value of an investment will fluctuate so that an investor's shares, when sold or redeemed, may be worth more or less than their original cost and current performance may be lower or higher than the performance quoted above.

Returns less than one year are cumulative.

Conclusion

Return stacking is reshaping how investors think about asset allocation by allowing them to introduce additional return streams to their existing portfolio **without compromising exposure to broad stocks and bonds**. In doing so, we believe investors gain the opportunity to enhance long-term returns and improve internal diversification.

We aim to help investors achieve these outcomes by offering pre-stacked solutions that can serve as portfolio building blocks. RSSB is designed to provide capital efficiency, allowing investors to free up room in their portfolio for creative cash management and overlay implementations. RSBT, RSST, RSBY, RSSY, RSBA, and RSSX seek to provide pre-stacked alternative solutions that allow investors to retain core stock and bond allocations while introducing exposure to trend-following, carry-based managed futures, merger arbitrage, and gold/bitcoin, respectively.

Taken together, we believe these seven building blocks provide investors with tremendous flexibility in portfolio design and the ability to rethink diversification within their portfolios.

We are excited for the future of this suite and the value that Return Stacked® funds can bring to investors.

Technical Glossary

*A **Basis Point** is equal to 0.01% and is commonly used to express changes in interest rates, fees, or investment returns. For example, 50 basis points equals 0.50%.*

***Correlation** measures the degree to which two investments move in relation to each other, ranging from -1 (perfectly inverse) to +1 (perfectly aligned).*

*The **Sharpe Ratio** measures an investment's return relative to its risk by comparing the excess return (above a risk-free rate) to the investment's volatility. A higher Sharpe ratio suggests better risk-adjusted performance.*

***Tracking Error** quantifies how closely a portfolio's returns follow those of its benchmark by measuring the standard deviation of the return differences. A lower tracking error indicates tighter alignment with a benchmark.*

Glossary

AlphaBeta Merger Arbitrage Index *is a rules-based index designed to systematically capture returns from announced merger and acquisition transactions. It tracks the performance of merger arbitrage strategies by holding long positions in target companies and selectively taking short positions in acquiring companies to isolate deal-related returns.*

Bloomberg Short Treasury Total Return Index Value Unhedged Index *is an index that covers U.S. Treasury Bills between 1-to-3 months in maturity.*

Bloomberg US Aggregate Bond Index *is an index that covers the broad U.S. investment grade, US dollar-denominated, fixed-rate taxable bond market.*

Bloomberg U.S. Treasury Total Return Unhedged Index *is an index that covers broad U.S. Treasury Bills, Notes, and Bonds.*

FTSE Global All Cap Index *is a market-capitalization weighted index representing the performance of large, mid, and small cap stocks globally.*

Generic 1st 'GC' Futures *is a continuous, front-month futures contract referencing COMEX gold futures, rolling forward as each contract approaches expiration. It represents the price of one gold futures contract nearest to delivery, widely used as a benchmark for gold exposure in financial markets.*

Generic 1st 'BTC' Futures *is a continuous, front-month futures contract referencing CME Bitcoin futures, rolling forward as each contract nears expiration. It represents the price of the Bitcoin futures contract closest to delivery and is frequently used as a benchmark for Bitcoin exposure in financial markets.*

S&P 500 Index *is an abbreviation for the Standard & Poor's 500, a market-capitalization-weighted index of 500 leading publicly traded companies in the U.S.*

Société Générale CTA Index *is designed to track the largest commodity trading advisors ("CTAs") in the managed futures space net of underlying fees. The index does not represent the entire universe of CTAs. Actual rates of return may be significantly different and more volatile than those of the index.*

Société Générale Trend Index *is designed to track the largest trend following commodity trading advisors ("CTAs") in the managed futures space net of underlying fees. The index does not represent the entire universe of all CTAs. Actual rates of return may be significantly different and more volatile than those of the index.*

Euro Bund *is a long-term bond issued by the Federal Republic of Germany, the Republic of Italy, the Republic of France, or the Swiss Federation.*

UK Gilt *is a UK Government liability in sterling.*

WTI *is West Texas Intermediate and is the benchmark for the U.S. light oil market, sourced from U.S. fields.*

Brent *is the benchmark used for the light oil market in Europe, Africa, and the Middle East, originating from oil fields in the North Sea between the Shetland Islands and Norway.*

RBOB *stands for Reformulated Blendstock for Oxygenated Blending, a component that is used to create formulated gasoline.*

Important Disclosures

Investors should carefully consider the investment objectives, risks, charges and expenses of the Return Stacked® ETFs. This and other important information about the ETFs is contained in their prospectuses, which can be obtained by calling 1-844-737-3001 or clicking here. The prospectuses should be read carefully before investing.

Investments involve risk. Principal loss is possible. Unlike mutual funds, ETFs may trade at a premium or discount to their net asset value. Brokerage commissions may apply and would reduce returns.

Derivatives Risk: *Derivatives are instruments, such as futures contracts, whose value is derived from that of other assets, rates, or indices. The use of derivatives for non-hedging purposes may be considered to carry more risk than other types of investments.* ***Cayman Subsidiary Risk:*** *By investing in the Funds' Cayman Subsidiaries, the Funds are indirectly exposed to the risks associated with the Subsidiaries' investments. The futures contracts and other investments held by the Subsidiaries are subject to the same economic risks that apply to similar investments if held directly by the Fund. The Subsidiaries are not registered under the 1940 Act, and, unless otherwise noted in the Funds' Prospectus, are not subject to all the investor protections of the 1940 Act.* ***Bond Risk:*** *The Funds will be subject to bond and fixed income risks through their investments in U.S. Treasury securities, broad-based bond ETFs, and investments in U.S. Treasury and fixed income futures contracts. Changes in interest rates generally will cause the value of fixed-income and bond instruments held by Funds (or underlying ETFs) to vary inversely to such changes.* ***Commodity Risk:*** *Investing in physical commodities is speculative and can be extremely volatile.* ***Commodity-Linked Derivatives Tax Risk:*** *The tax treatment of commodity-linked derivative instruments may be adversely affected by changes in legislation, regulations, or other legally binding authority. As registered investment companies (RIC), the Funds must derive at least 90% of its gross income each taxable year from certain qualifying sources of income under the Internal Revenue Code. If, as a result of any adverse future legislation, U.S. Treasury regulations, and/or guidance issued by the Internal Revenue Service, the income of the Funds from certain commodity-linked derivatives, including income from the Funds' investments in the Subsidiary, were treated as non-qualifying income, the Funds may fail to qualify as RIC and/or be subject to federal income tax at the Fund level. The uncertainty surrounding the treatment of certain derivative instruments under the qualification tests for a RIC may limit the Funds' use of such derivative instruments.* ***Commodity Pool Regulatory Risk:*** *The Funds' investment exposure to futures instruments will cause it to be deemed to be a commodity pool, thereby subjecting the Funds to regulation under the Commodity Exchange Act and the Commodity Futures Trading Commission rules. Because the Funds are subject to additional laws, regulations, and enforcement policies, they may have increased compliance costs which may affect the operations and performance of the Funds.* ***Credit Risk:*** *Credit risk refers to the possibility that the issuer of a security will not be able to make principal and interest payments when due. Changes in an issuer's credit rating or the market's perception of an issuer's creditworthiness may also affect the value of the Funds' investment in that issuer.* ***Currency Risk:*** *Currency risk is the risk that changes in currency exchange rates will negatively affect securities denominated in, and/or receiving revenues in, foreign currencies. The liquidity and trading value of foreign currencies could be affected by global economic factors, such as inflation, interest rate levels, and trade balances among countries, as well as the actions of sovereign governments and central banks.* ***Equity Market Risk:*** *By virtue of the Funds' investments in equity securities, equity ETFs, and equity index futures agreements, the Funds are exposed to equity securities both directly and indirectly which subjects the Funds to equity market risk. Common stocks are generally exposed to greater risk than other types of securities, such as preferred stock and debt obligations, because common stockholders generally have inferior rights to receive payment from specific issuers. Equity securities may experience sudden, unpredictable drops in value or long periods of decline in value. This may occur because of factors that affect securities markets generally or factors affecting specific issuers, industries, or sectors in which the Fund invests.* ***Foreign and Emerging Markets Risk:*** *Foreign and emerging market investing involves currency, political and economic risk.* ***Leverage Risk:*** *As part of the Funds' principal investment strategies, the Funds will make investments in futures contracts to gain long and short exposure across four major asset classes (commodities, currencies, fixed income, and equities). These derivative instruments provide the economic effect of financial leverage by creating additional investment exposure to the underlying instrument, as well as the potential for greater loss.* ***Non-Diversification Risk:*** *The Funds are non-diversified, meaning that they are permitted to invest a larger percentage of its assets in fewer issuers than diversified funds.* ***Underlying ETFs Risk:*** *The Funds will incur higher and duplicative expenses because they invest in ETFs. The Funds may also suffer losses due to the investment practices of the underlying ETFs.* ***New Fund Risk:*** *The Funds are recently organized with no operating history. As a result, prospective investors do not have a track record or history on which to base their investment decisions.* ***Bitcoin Investment Risk:*** *The Fund's indirect investment in bitcoin, through futures contracts and Underlying Funds, exposes it to the unique risks of this emerging innovation. Bitcoin's price is highly volatile, and its market is influenced by the changing bitcoin network, fluctuating acceptance levels, and unpredictable usage trends. Not being a legal tender and operating outside central authority systems like banks, bitcoin faces potential government restrictions. The value of bitcoin has historically been subject to significant speculation, making trading and investing in bitcoin reliant on market sentiment rather than traditional fundamental analysis.* ***Blockchain Technology Risk:*** *Blockchain technology, which underpins bitcoin and other digital assets, is relatively new, and many of its applications are untested. The adoption of blockchain and the development of competing platforms or technologies could affect its usage.* ***Digital Asset Risk:*** *Digital assets like bitcoin, designed as mediums of exchange, are still an emerging asset class and are not presently widely used as such. They operate independently of any central authority or government backing and are subject to regulatory changes and extreme price volatility.* ***Potentially No 1940 Act Protections:*** *It is expected that one or more Underlying Funds will not be registered as an investment company subject to the 1940 Act. In addition, Underlying Funds that invest directly in bitcoin or gold are not subject to the 1940 Act. Accordingly, investors in such an Underlying Fund would not have the protections expressly provided by that statute.*
